

To-Do List App API

Project: To-Do List API

Overview

You will develop a **RESTful API** for managing a simple To-Do list application. The API will allow users to create task lists, add tasks to those lists, mark tasks as done, and manage their data efficiently.

 **No authentication or authorization is required.**

Requirements

1. Task List Management

- Users should be able to:
 - **Create** a new task list.
 - **Update** a task list (rename it).
 - **Delete** a task list (along with its tasks).
 - **Upload a picture** for a task list (Challenge: file handling).
 - The picture should be stored **locally** (or in cloud storage for extra challenge).
 - When retrieving a task list, the picture URL should be included.

2. Task Management

- Each task belongs to **one task list**.
- Users should be able to:
 - **Create** a task inside a list.
 - **Retrieve** all tasks in a list.
 - **Update** a task (change its title or description).
 - **Delete** a task.

- **Marking Tasks as Done** (Once a task is marked as done, it **should not be editable**)
 - In addition to typical fields of a task, each task must have:
 - An optional due date
 - Priority
-

Technical Details

- Use **ASP.NET Core Web API**.
 - Use **Entity Framework Core** (Code-First approach).
 - Use **SQL Server**
 - Implement proper **RESTful principles**.
 - Return proper **HTTP status codes**.
 - Handle **file uploads** properly (e.g., validate file type & size).
 - Implement sorting
 - Use Swagger/Open-API for documentation
 - Do not use hard delete
 - Give flexible search capabilities to API clients
-

Bonus (Optional for Extra Learning)

- Store images in an Object Storage like Arvan-Cloud object storage (If it has no cost)
-

Expected Deliverables

- Source code in a Git repository.
- A **Postman collection** for testing API endpoints.
